

CUT-OFF TEETH

Cutoff teeth are made of high quality alloy steel precisely heat treated to provide excellent shock and wear resistance. All teeth are precision milled to insure a consistently perfect fit in our saw plates.

FUTURE-2000™ (Carbide Tipped)

Future-2000™ cut-off tooth features the most advanced cutting technology. The innovative, double pointed, carbide tips cut freer and track better than left and right hand teeth. Center Tracking significantly reduces crack causing vibration and the teeth stay tighter in the saw. The double pointed carbide tips actually shear wood fibers instead of tearing them. The self-aligning tips can be brazed onto the teeth without removing the teeth from the saw. The Future- 2000™ eliminates the need for left and right hand teeth.
